Intake Service Kit

De-Carbonization Kit

Driveability Service Kit

Multi Channel Opportunity, Multi Service Kit Offering

The best way to capture market share is to be able to differentiate customers from one another in the same marketplace. For this reason, SimplyBulk has created service kits that enable professional service locations to offer a similar service using different service kits.

De-carbonization Service Kit: Dissolves and removes carbon deposits within the combustion chamber. The service kit uses vacuum to draw cleaning fluid into the combustion chamber.

Intake Service Kit: Dissolves and removes varnish and wax build-up in the air intake, intake manifold and intake valves. The service kit uses pressure to atomize the cleaning fluid into the air intake system.

Driveability Service Kit: A combination service kit that provides carbon deposit and intake system removal using a two step process using one service kit. The specialized cleaning fluids are diffused into the engine using pressure to atomize the cleaning agents.
